Summary

Full-Stack Engineer specializing in platform infrastructure building infrastructure for scale. Expert in Go/Node.js, cloud architecture (GCP), and distributed systems (Redis, MQTT, IoT). Delivered measurable impact: 80% database cost reduction, 500ms API latency improvement, and secure OTA infrastructure for IoT fleet. Passionate about enabling teams to ship fast and operate reliably.

Technical Skills:

- Languages – Go, JavaScript, TypeScript, Python, Java, SQL
- Frontend – React, Next.js, Redux, TailwindCSS, Material UI, Shadcn, React Query
- Backend – Go, Node.js, REST APIs, WebSockets, Server-Sent Events
- Database – PostgreSQL, MongoDB, Redis, Firebase, InfluxDB
- DevOps & Cloud – Google Cloud Platform (Compute Engine, Cloud Armor, IAM, Secret Manager), Docker, CI/CD, Linux, Git
- Distributed Systems & IoT – Redis caching, MQTT (ACL-based), real-time messaging, event-driven architectures, multi-tenant authentication, Raspberry Pi (embedded Linux)

Experience:

Software Developer – Krishworks Technology June 2024 - Present

- Led multiplayer game infrastructure team to deliver 1-month project in 1.5 weeks (25% faster), resolving critical concurrency bottlenecks in Redis-based server coordination. Reduced CPU usage by 35%, increased concurrency by 48%.
- Developed SaaS admin dashboard ahead of schedule using TypeScript + Next.js 19, leveraging React 19 async UI patterns (Server Components, Suspense) for optimized performance. Established frontend architecture best practices adopted across team.
- Built end-to-end OTA update system for Raspberry Pi fleet: developed React frontend, integrated Golang backend, and orchestrated deployment scripts. Enabled remote firmware updates with zero-downtime deployment across production devices.
- Reduced Firebase read operations by 80% via Redis caching layer + optimized access patterns, cutting database costs and load while enabling game server scalability.
- Identified malicious code injection incidents and led security hardening: deployed Google Armor DDoS protection, Secret Manager credential rotation, and IAM policies. Established Git security standard (GPG-signed commits) across all repositories.
- Migrated high-volume logging to InfluxDB time-series architecture, improving API response latency by ~500ms and enabling real-time telemetry monitoring. Implemented frontend multilingual caching (IndexedDB), reducing page load times by 1.4 seconds for users.
- Architected multi-tenant MQTT communication with user-level ACL rules + API-key authentication, reducing auth latency via caching and enabling secure device connections.
- Owned GitHub org governance (branch protection, review gates, required CI checks), improving release reliability and reducing unsafe production merges.

Full Stack Developer – Work Technologies January 2024 – March 2024 (Freelancing)

[Link](#)

- Architected and delivered 2+ production-ready client applications using React and Node.js.
- Designed scalable frontend architecture with reusable components for maintainable UI development.

Projects:

3rd Step Verification 2/10/2023 – 15/5/2024

[Link](#)

- Designed a blockchain-based verification mechanism using cryptographic hash keys to solve multi-step authentication issues in a social media workflow.

Speak to Doc 2/8/2023 – 15/9/2023

[Link](#)

- Engineered an innovative, **voice-command website** for note-making and letter writing, emphasizing accessibility for users with disabilities.

LLM Based Chatbot

[Link](#)

- Developed and integrated an LLM-based chatbot system using few-shot prompt engineering and contextual awareness to streamline the college admission process and automate responses to student queries.

Education:

2020 - 2024

B.Tech – Computer Science and Engineering, Nanasaheb Mahadik College of Engineering, Sangli

CGPA: 8.00
